Be sure to tell Dr. Watters of your concern. And it's important to have a physician that you trust and it's a good idea to seek a second opinion if you are dissatisfied with your care.

He didn't say what it showed. What ever it was won't hurt you, I don't agree with that by our health. I do know the house smells like ammonia all the time, I have a tester on the way, am going to start checking levels. Spoke with Dr Kroll yesterday, this has me concerned, he stated I had 2 abnormal ECG tests, but disregarded them as a machine fault, both show that I had a major heart attack in the left side of my heart. I can tell you the day this happened, I had gotten into this gas? had a terrible stabbing pain in my back under my left shoulder, felt like someone stabbed me with a knife and I could not breath, and this is why the allergy Dr in Minot told me to go have cardio tests, he suspected this. Why is this not taken seriously?
